

EXPLORE EARTH

YOUR HOME, OUR MISSION

Earth Information System (EIS)

Monthly Highlights February 2024

AMSR-E/AMSR2/MOD

SWOT surface water exten

Updating the global terrestrial water cycle synthesis

The EIS team is developing an updated global land reanalysis dataset informed by a comprehensive set of remote sensing observations of precipitation (GPM V7A), soil moisture (ESA CCI, SMAP), leaf area index (MODIS, VIIRS), Snow depth (AMSR-E, AMSR2), terrestrial water storage (GRACE and GRACE-FO), and surface water (Surface Water Ocean Topography), globally at 5km resolution.

Allows a monitoring environment for the assessment of hydrological extremes (droughts, floods); Designed to support global water resources and agricultural applications.

High resolution North American land analysis taking shape

North American Land Data Assimilation System Phase 3 (NLDAS-3)

A 1km scale North American land analysis to support drought monitoring, water resources management, agricultural applications Update:

NLDAS-3 uses advanced data assimilation techniques to blend well known and meteorological datasets (MERRA-2, IMERG, CaPA from

ECCC)

Retrospective		Near Real-Time		
1980	Present			
	MERRA-2 (~3 weeks)		GEOS FP-IT (~7hrs)	
1980	2018	2019 Present		
	CaPA rdrs (completed)	CaPA rdpa	CaPA rdpa (<7hrs)	
	2001	Present		
	IMERG Final (~3.5 months)		IMERG E (~7 hrs)	
1980	Present			
Rain Gauge Observations			Rain Gauge Observations	

NLDAS-3

The modeling system is being configured to assimilate all hydrology relevant remote sensing inputs (GPM, SMAP, GRACE, MODIS, VIIRS, SWOT, ...)

Will routinely run at NASA SPoRT and provide assessments of hydrological extremes (droughts, floods)

Will include water quality quantifications in addition to water availability assessments

EIS Engagement and Outreach Activities

Organization/ Meeting	Date(s)/Location	Thematic Area	Activity/ Outcome
FEMA tech talk	Feb 6, 2024	Water, Fire	The EIS and the NASA disasters teams discussed the possible use of EIS synthesis to support FEMA needs
